LIVE TRACK

Real-time GPS fleet tracking

Platform Change Report

Everything that changed on Live Track, in one document.

Wednesday, 9 September 2026

Prepared for the Live Track team.

What is Live Track?

Live Track is a real-time GPS fleet-tracking web app. Any smartphone becomes a live GPS device -- no hardware, no SIM cards.

Drivers open the app, tap Start tracking, and stream their position, speed, battery and status to an admin dashboard that shows every vehicle on one map. Admins can replay any driver's day, download PDF trip reports, and see human-readable street names for every stop.

This document summarises what the platform used to look like, what changed, and where it is today -- so anyone joining the team can get up to speed quickly.

The people who use it

- Drivers open the app on any smartphone and tap Start tracking. Their position streams live to the admin.
- Admins watch every vehicle on one map, filter and search, replay any day's route, and download PDF trip reports.

Before -> After, at a glance

A one-table summary of every visible change. Details for each row follow in later sections.

Area	Before	Now
Auth	Instant logout, "failed to fetch", session lost within seconds.	Sessions are stable. Signup returns a session immediately (email auto-confirm).
RLS policies	Missing on device_status and location_history -- every write blocked.	Full RLS suite restored, verified via advisors. Own-row + admin-read.
Signup form	Name + vehicle name + email + password only.	+ Vehicle type (9 options), plate number, seat count (bus/van).
Vehicle icons	Generic lucide icons -- Van looked like a box.	Custom SVG silhouettes: sedan, SUV, cargo van, semi-truck, pickup with bed, bus with windows, motorbike, bicycle.
Admin dashboard	Vehicles disappeared from the map when a filter was applied.	Map always shows every driver; filter only narrows the list.
Status colors	Stopped = red (confusing).	Moving = green, Parked = calm blue, Idle = amber, Offline = gray.
Driver info shown	Name, vehicle name, km/h.	+ Plate pill, phone on/off, battery warning, street name, LIVE badge.
Map style	Tiles hid street names in dark mode.	CARTO Voyager tiles -- street names readable in both themes.
Trip history	Did not exist.	/history: pick driver + date, see polyline route, stops with addresses, summary tiles.
PDF report	Did not exist.	One-click daily report: driver, plate, seats, distance, driving/stopped time, top speed, stops with addresses, sampled points, battery start/end.
Wake Lock	Screen turned off, tracking stopped.	Wake Lock keeps the screen on for the whole shift, reacquired on tab-focus.
Reverse geocoding	Only raw coordinates shown.	Human-readable addresses via OSM Nominatim, cached in sessionStorage.
Landing page	Basic hero + 6 static feature cards + "Built with Lovable" footer.	Animated world with vehicle icons moving between cities, live-preview mock, stats strip, feature grid, 3-step how-it-works, use cases, dark CTA, 3-column footer.
Mobile responsive	Panels stacked awkwardly, list scrolled past map.	Tab-switch layout (Drivers <-> Map on /dashboard, Trip details <-> Route on /history) below 1024px.
Positioning	Freemium copy ("Start tracking free").	Enterprise / B2B copy: "Access your workspace", built for fleet operators.
Deployment	Cloudflare-only wrangler config, no .env.example.	vercel.json + api/ssr.js Node function, .env.example, .gitignore protects .env, ready for one-click Vercel deploy.

Bugs fixed

These are the concrete defects users could see before, and how each was addressed.

FIXED

Instant logout after login

BEFORE

Users were signed out within seconds of logging in -- 'failed to fetch' toasts, session vanished.

NOW

Removed the redundant getSession() race that fought onAuthStateChange, and stopped calling supabase.auth.getUser() inside use-tracker. No more AuthRefreshDiscardedError.

FIXED

"new row violates RLS policy for device_status"

BEFORE

Right after signup the tracker's first upsert raced ahead of the auth token being attached to the Supabase client, spamming a red toast.

NOW

Transient RLS/JWT errors are retried up to 3x with backoff and never surface to the user. Only genuine errors reach the UI.

FIXED

Vehicle disappearing from the map

BEFORE

When an admin filtered the list to Moving/Parked/etc., matching vehicles also disappeared from the map.

NOW

The map now always renders every driver. Filters only narrow the side list.

FIXED

Stale error message

BEFORE

Once the tracker errored, the red banner stayed on screen even after subsequent successful updates.

NOW

Successful persists clear stats.error.

FIXED

Wrong Supabase project

BEFORE

.env pointed to a project that didn't exist in the account, breaking every fetch.

NOW

.env fixed. .env.example committed. Real values live only in local .env / Vercel dashboard.

FIXED

Loading screen looked like a blank blue page

BEFORE

Dashboard showed muted-on-muted 'Loading...' text with no background -- read as 'the app is broken'.

NOW

Explicit background, spinner icon, clear label.

New features

Capabilities that did not exist (or did not work) in the previous version.

Signup with vehicle profile

Driver name, vehicle name, plate number, vehicle type from a 9-option grid, and seat count for buses/vans -- all captured on signup and stored on the profile.

Realistic vehicle icons

Custom SVG silhouettes for each type. Icons render both in the signup grid, in the driver list, and inside the map markers.

Real-time admin dashboard

Every vehicle on one CARTO Voyager map with a vehicle-shaped marker. Side list shows driver, plate, vehicle, speed, address, battery, and 'Phone off' chip when the driver stops tracking. Realtime updates via Supabase channels.

Human-readable addresses

OSM Nominatim reverse-geocoding with in-memory + sessionStorage cache and in-flight dedupe. Shown on tracker, dashboard cards, map popups, and PDF reports.

Trip history + route playback

/history route: admin picks a driver + a date, sees the day's polyline on the map with stop pins. Summary tiles: distance, driving time, stopped time, top speed.

PDF daily reports

One-click download: purple gradient header, identity card with plate, six summary tiles, route overview with battery start/end + drop, stops table, sampled points table. Footer on every page.

Wake Lock while tracking

Screen stays on for the entire shift so the tab isn't backgrounded and throttled. Lock is reacquired when the tab returns to visible.

Mobile-first responsive layout

Below 1024px, both /dashboard and /history collapse to a tab-switch layout so the map and the driver list each get full-width real estate. Header labels drop to icons.

Auto-confirmed accounts

A BEFORE INSERT trigger on auth.users sets email_confirmed_at so signUp() returns a session immediately -- no verification email required for this deployment.

Deployment-ready repo

vercel.json + api/ssr.js Node function wrap the TanStack Start SSR bundle. .env.example documents required vars. .gitignore prevents leaking .env. README walks through the 5-step Vercel deploy.

Under the hood

For anyone who wants to open the code - here's how the pieces fit together.

Database schema
user_roles (admin/user enum), profiles (display_name, vehicle_name, vehicle_type enum, plate_number, seats), device_status (per-user snapshot), location_history (per-point log). RLS enabled on all four.

RLS policies
SELECT own row OR admin (via has_role SECURITY DEFINER helper). INSERT/UPDATE limited to own user_id.

Migrations
restore_rls_policies_and_triggers, auto_confirm_email_on_signup, add_vehicle_type, add_plate_and_seats.

Realtime
device_status REPLICA IDENTITY FULL and added to supabase_realtime publication. Dashboard subscribes to postgres_changes for live updates.

Auth model
Client uses supabase-js v2 with autoRefreshToken. Auth context single-flights role fetches to avoid concurrent refresh cycles.

Frontend stack
TanStack Start (SSR) + React 19 + Tailwind CSS 4 + Framer Motion + Leaflet + Lucide + jsPDF + jspdf-autotable.

How people use it, step by step

Driver

- 1. Open the app, tap Create account.
- 2. Fill in name, vehicle name, plate number, pick vehicle type (bus/van also asks for seat count).
- 3. Enter email + password -> account is created + session issued instantly (no email verification).
- 4. Land on /track. Location permission is requested. Tap Start tracking.
- 5. Status shows Parked/Moving with a LIVE pulsing badge. Speed, distance, battery, address all update live.
- 6. Wake Lock keeps the screen on. Stop tracking any time.

Admin

- 1. Sign in - land on /dashboard (once the account has been promoted to admin in user_roles).
- 2. See every driver as a vehicle-shaped marker on the map, plus a side list with plate, address, battery, phone status.
- 3. Filter list by status (All/Moving/Parked/Idle/Offline) or search by name/plate/street. Map still shows everyone.
- 4. Click History -> pick a driver + date -> see the full route polyline with stops.
- 5. Click Export PDF -> downloads a full daily report.

Deploying to Vercel

The repo is already configured. Steps to push to production:

- Push the repo to GitHub.
- In Vercel: Add New Project -> Import the repo.
- Framework preset: Other (vercel.json handles it).
- Set env vars from .env.example: SUPABASE_URL, SUPABASE_PUBLISHABLE_KEY, VITE_SUPABASE_URL, VITE_SUPABASE_PUBLISHABLE_KEY.
- Deploy. Static assets are served from dist/client, SSR is served by api/ssr.js on the Node runtime.
